Why Use Living Mulches?
Weed control "Designated weed" to suppress weeds
Nitrogen accumulation through nitrogen fixation; possible mobilisation of other nutrients
Reducing tillage to enhance soil physical characteristics
Conventional farmers – reduce reliance on glyphosate

Trees, climate change and RESILIENCE

Will Simonson looks at the way climate change will impact our farms and how we need to plan carefully for the future when choosing tree species to plant

A new National Risk Register, published in the summer, placed extreme weather events among the main threats facing the UK. Drought, heatwaves, storms, coastal and fluvial flooding are all included at varying degrees of likelihood and impact on Britain's landscapes and farming. Wildfires are listed too and, in the summer of last year, we saw unprecedented impacts on croplands as well as heathlands and other vegetation. Climate change is no longer just a future concern.

There has been a lot of interest in agroforestry as a 'nature-based solution' to climate change. The ability of trees on farms to store carbon in its biomass above and below ground as well as soils offers the potential to contribute to climate change mitigation and net zero targets. However, the role of trees in helping to adapt farms
